You will need the class Car for the next exercises. The class Car has four data attributes: make, model, colour and number of owners (owner_number). The method `car_info()` prints out the data attributes and the method `sell()` increments the number of owners.

In [1]:

```
class Car(object):
    def __init__(self,make,model,color):
        self.make=make;
        self.model=model;
        self.color=color;
        self.owner_number=0
    def car_info(self):
        print("make: ",self.make)
        print("model:", self.model)
        print("color:",self.color)
        print("number of owners:",self.owner_number)
    def sell(self):
        self.owner_number=self.owner_number+1
```

Create a Car object

Create a `Car` object my_car with the given data attributes:

In [3]:

```
make="BMW"
model="M3"
color="red"
def car(make, model, color):
    car
```

Data Attributes

Use the method car_info() to print out the data attributes

In [ ]:

```

```

Methods

Call the method `sell()` in the loop, then call the method `car_info()` again

In [ ]:

```
for i in range(5):

```
